

Problem Statement 1: Movies and TV Shows

Problem Statement

A streaming platform's content team manages a large and growing catalog of Movies and TV Shows spanning countries, genres, and release years, but has no consolidated view of catalog composition or acquisition trends. This makes it hard to answer basic content-strategy questions — which genres and content types dominate the library, how ratings are distributed, and whether content acquisition is growing or slowing — without manually filtering spreadsheets.

Objective: Build a Power BI report that gives the content team a self-service view of the catalog — by type, genre, rating, and country — to support content acquisition and programming decisions.

Key business questions

1. Which content type (Movie vs. TV Show) and which genres dominate the catalog?
2. How has content acquisition trended over time, and which countries contribute the most titles?

Scope: Title-level catalog data (type, title, director, cast, country, date added, release year, rating, duration, genre); one Power BI report with an executive summary page, built using Power Query transformations and implicit (drag-and-drop) measures.

Data Acquisition and Preparation

Import the provided CSV into Power BI Desktop (Home → Get Data → Text/CSV → Transform Data) and perform the following Power Query transformations:

Step	Action
Change data type	Convert date_added to Date; convert release_year to Whole Number
Remove duplicates	Check for and remove duplicate rows on show_id / title
Clean and trim	Trim/Clean extra spaces from director, cast, country, and title
Replace null/blank values	director, cast, and country commonly contain blanks in this dataset — replace with "Unknown" or filter, with the choice justified

Add a new column	Extract Year Added from date_added (Add Column → Date → Year), or split duration into a numeric Duration (Minutes) / Seasons column
------------------	---

End with Close & Apply to load the cleaned data into the model.

Interactive Report and Executive Summary

All figures use implicit measures — drag a field into a visual and set the aggregation in the Values well.

Executive Summary KPI cards

- Total Titles (Count of title)
- Movie Count and TV Show Count
- Distinct Countries (Distinct Count of country)
- Distinct Genres (Distinct Count of listed_in)

Exploratory Data Analysis

- Titles by Type (Movie vs. TV Show)
- Titles by Rating (e.g. TV-MA, PG-13, R)
- Top 10 Genres by Title Count
- Distribution of Movies vs TV Shows

Table graph

- Title, Director, Country, Release Year, Rating, Duration — sortable and filterable

Tooltip

- Build a tooltip page showing Cast and Description when hovering over a title in the table or a genre bar

Insights

1. Which content type and genres dominate the catalog, and does that differ by country?
2. How has content acquisition (titles by date added / release year) trended over time — growing, flat, or slowing?

End with 1–2 concrete recommendations for the content/acquisition team based on these findings.
